

To provide an accurate estimate, I have categorized this as a **Mid-Sized Enterprise Banking System** (Web-based, secure, RESTful API architecture, high-availability requirement).

Note: Costs are estimates based on US-market standards and typical cloud resource scaling for a new financial application.

Project Cost Breakdown

Category	Description	Estimated Cost (One-time/Yearly)
Development Cost	Full-stack development (Team of 3: Backend, Frontend, DevOps) over 4 months.	\$80,000 – \$120,000
AI API Cost	Fraud detection & document parsing (OpenAI/Anthropic/AWS Fraud Detector).	\$300 – \$800 / month
Hosting Cost	High-availability Cloud (AWS/Azure/GCP) + Load Balancing.	\$250 – \$600 / month
Database Cost	Managed SQL (RDS) + Encrypted Cold Storage + Backups.	\$150 – \$400 / month
Maintenance Cost	Security patching, compliance audits, and bug fixes (Retainer).	\$2,000 – \$4,000 / month

Executive Summary

1. Development Cost (\$100,000 avg)

This includes requirement gathering, architecture design (Microservices/Monolith), database schema design, banking-grade security implementation (OAuth2/OpenID), and 3rd party API integrations (Stripe, Plaid, or KYC providers).

2. Monthly Recurring Cost (\$2,700 – \$5,800)

This covers the operational expenses required to keep the system live, performant, and secure.

- AI API:** Fluctuates based on user volume and number of fraud checks performed.
- Hosting/DB:** Tiered pricing based on concurrent connections and encrypted storage requirements.

-
- **Maintenance:** Mandatory for banking systems to ensure compliance with financial regulations (e.g., SOC2, PCI-DSS).

3. Yearly Total Cost (\$32,400 – \$69,600)

This represents the "Run-the-Bank" operational budget.

Critical Considerations for Banking Software

- **Compliance Costs:** Because this is a Banking Management System, you must account for **Security Audits and Penetration Testing**. Budget an additional **\$5,000–\$10,000 annually** to hire a third-party security firm to audit your endpoints.
- **Database Redundancy:** Banking data requires Multi-AZ (Availability Zone) deployment, which effectively doubles your database hosting costs but is non-negotiable for data integrity.
- **AI Usage:** If the AI features involve LLM-based financial advice or document processing, the cost will scale linearly with the number of users.

Would you like a more granular breakdown based on specific technologies (e.g., Node.js vs. Java Spring Boot, or AWS vs. DigitalOcean)?
